CACM Research Highlights

The Research Highlights section of the [Communications of the ACM](#) aims to provide readers with a collection of outstanding research articles, selected from the broad spectrum of computing-research conferences. Starting this year, SIGLOG is an approved nominating organization for the Research Highlights section. Accordingly, the Research Highlights Committee of ACM SIGLOG is looking for nominations of high-quality papers **from the past year** in the areas related to SIGLOG that can be appreciated by the broader public of the computer science research community.

There are three key criteria for a good Research Highlights paper:

- The work must be a **strong, novel research contribution**.
- It should be **of broad interest to the computing community**. (This means the selection criterion is not necessarily the same as that for Best Papers and other awards, which can recognize papers that are quite narrow and focused on a very small community.)
- Papers should have that **little extra "pop"** that sets them apart even from other strong results in their field. A nomination should suggest that you think a paper should be one of the most widely read papers in computer science.
